Assumptions

- All identifying attributes (owner_id, pet_id) are numeric, to simplify the generation of a new value.
- The owner might not have a preferred vet, as they could be visiting for the first time.
- The owner must have both, a given and family name.
- vet_id is a surrogate key for VISIT, as it is dependent on both the VET table and the VISIT table. There can be multiple visits at a time with different vets and different pets/owners.
